

# Fraternity Information Database

Christian Armatas  
Mihai Dan

<http://web.engr.oregonstate.edu/~danm/cs275project/index?home=Home+Page>

## 1. Introduction

We designed and created a database for the Oregon State Greek Life. The database will provide a pool of information of members in each fraternity, parties, and positions within each house. In OSU Greek Life, each member is associated with one fraternity; some members are able to be elected into a position, while some are not affiliated with any positions. This database also keeps track of attendance at parties, whether or not a member brought a guest, and if a member is sober and responsible for others in attendance. This program might actually be of use to a fraternity who is looking to keep track of members, position information, and party information.

The FRATERNITY entity has five attributes, with fName and Chapter being the primary keys. The other attributes are # of Members, Colors, and Address.

The MEMBER entity has seven attributes, with mName and sID being the primary keys. The MEMBER table contains two foreign keys in our relation table, fName and Chapter, in order to connect each member to their specific fraternity. The other attributes are Age and Year in the House, and Major.

The POSITION entity is denoted by the primary key pName and has Rank, Date Elected, and Description as its attributes. The foreign key sID is used to associate each member with a position.

The PARTY entity has partyName and Location (as in, which fraternity is hosting) as primary keys and has Date, Time, Theme, Additional Hosting Houses as its attributes. The two foreign keys in PARTY are fName and Chapter of the hosting house.

The ATTENDANCE entity has sID as its primary key. partyName and Location are its foreign keys. Its other attributes consist of whether a member is sober or not (denoted by “Sober Brother”) and whether or not a member invited guests or a date.

## Functionality

The user can print a list of every member in the fraternity. If desired, the user is able to select a member by their sID and get all the information on specified member. This database can hold information on parties, which the user could access, either to add an event or check on planned events. The user will also be able to see who was at a party and whether or not a specific member was sober or not. Position descriptions and ranks are available to the user, as well as which members filled a specific position. The database keeps organized information about fraternities and members.

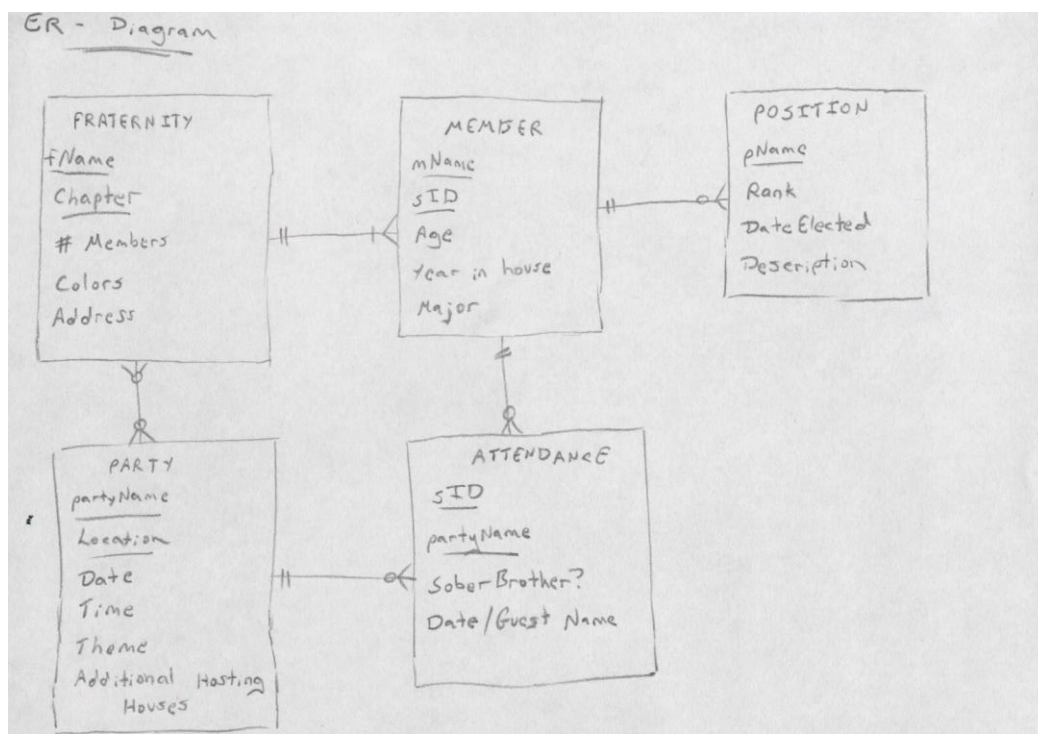

## 2. Detailed Application Requirements

A requirement of this application was to create a functioning webpage/directory where the user can input desired information about several fraternity's membership information and party information. After pressing the "submit information" button on each input page, the user is linked to a confirmation page which displays the relevant information back to the user.

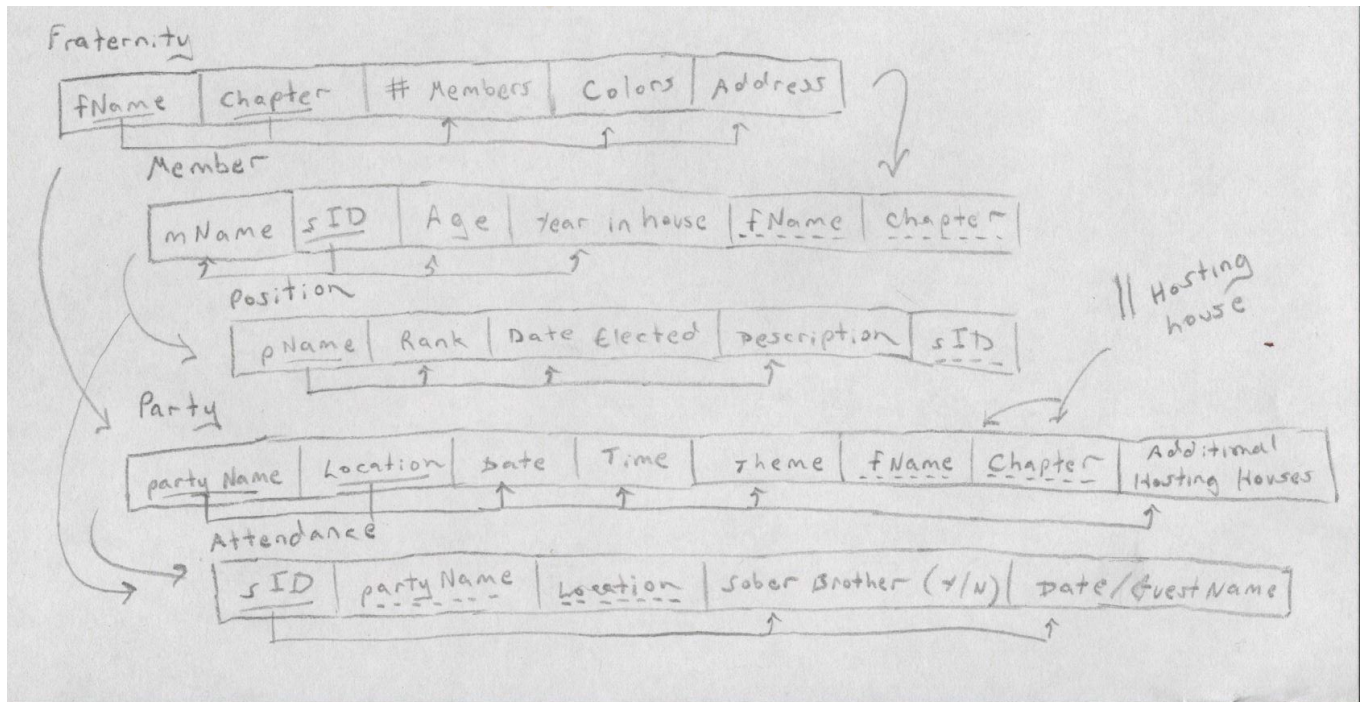

Certain required pages allow the user to display information regarding their particular fraternity. For example, "Print Membership Information" will ask the user to input a fraternity name and chapter and return to the user all members and their respective names, ages, and year in house (assuming a member exists in that fraternity and chapter). This requires access to the database management system which can search previously entered data to sort and display.

## 3. Design

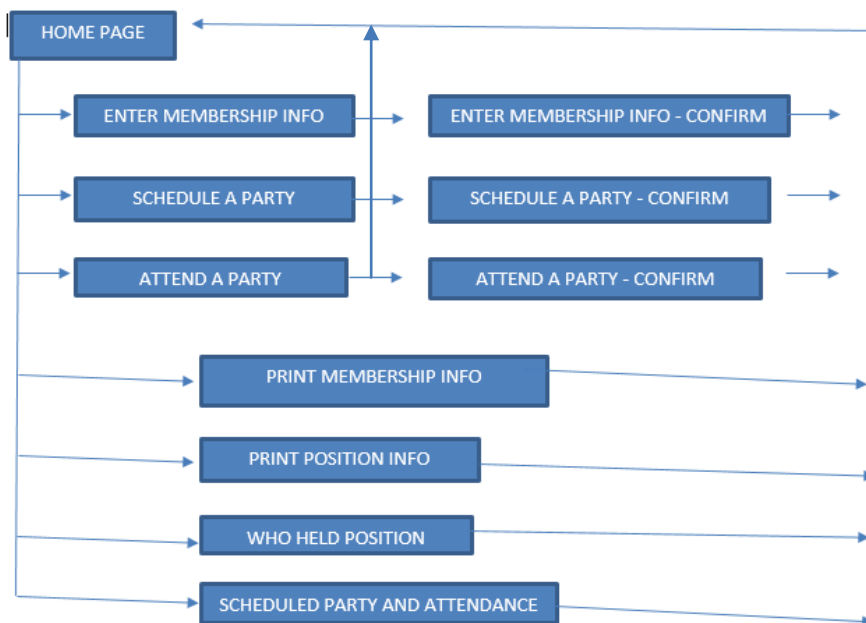

### a. ER Diagram of Database

## b. Relational Model

## c. Website Layout

## d. User Interface

### a) Main Page (index.html):

Fraternity Information Database - Home Page			
<a href="#">Enter Membership Information</a>	<a href="#">Print Names of Members</a>	<a href="#">Print Position Information</a>	<a href="#">Who Held Your Position?</a>
<a href="#">Schedule a Party</a>	<a href="#">Attend a Party</a>	<a href="#">Scheduled Parties and Current Attendance</a>	
Copyright © 2014 Christian Armatas and Mihai Dan.			

The main page serves an important part of the functionality of the website. It provides the user with the ability to navigate through the pages in an easy to follow menu.

### b) Enter Membership Information (enterMembershipInfo.php):

The Enter Membership Information page is the first page available in the menu. This webpage asks the user for personal information such as Student ID and age. Below, there is also an optional input box in case the member is holding a position in the house. This information gets submitted to the confirmation page shown part c.

Enter Membership Information	
Student ID:	<input type="text"/>
First/Last Name:	<input type="text"/>
Age:	<input type="text"/>
Fraternity Name:	<input type="text"/>
Chapter:	<input type="text"/>
Year in House:	<input type="text"/>
Position Information	
Position Name:	<input type="text"/>
Date Elected:	<input type="text" value="mm / dd / yyyy"/>
Position Rank:	<input type="text"/>
Description:	<input type="text"/>
<input type="button" value="Submit"/>	
<a href="#">Home Page</a>	

### c) Member Info Confirmation (confirmInput.php):

**Confirmation**

Thank you Mihai Dan for submitting your membership information.

Student ID: 932146380  
Age: 19  
Fraternity: Lambda Chi Alpha  
Chapter: Alpha Lambda  
Year in House: sophomore

Position: Scholarship Chair  
Date Elected: 2014-12-01  
Rank: 6  
Description: deals with scholarships and fraternity grades

[Home Page](#)

This page takes the information previously input into the Enter Membership Information webpage and displays it for the user to make sure everything was input correctly.

### d) List of Members (printMembers.php):

List of Members provides the user with an input box asking for their fraternity name and chapter. If there are members in the specified fraternity, their names, age, and year in the house will print out underneath the input box for easy accessibility.

**List of Members**

Fraternity Name:   
Chapter Name:

[Enter](#)

Name: Logan Troyer  
Age: 19  
Year In House: Sophomore

Name: Mihai Dan  
Age: 19  
Year In House: sophomore

[Home Page](#)

### e) Print Position Information (printPositionInfo):

**Print Position Information**

Fraternity Name:   
Chapter Name:

[Enter](#)

Fraternity Name: Lambda Chi Alpha  
Chapter: Alpha Lambda  
Member Name: Logan Troyer  
Position Name: Recruitment chair  
Date Elected: 2014-12-01  
Rank: 5

Fraternity Name: Lambda Chi Alpha  
Chapter: Alpha Lambda  
Member Name: Mihai Dan  
Position Name: Scholarship Chair  
Date Elected: 2014-12-01  
Rank: 6

[Home Page](#)

Much like the webpage described in section d., Print Position Information asks the user for their fraternity name and chapter, and displays information about the positions in the house, such as the member holding the position and the date elected.

**f) Who Held Your Position? (whoHeldPos.php):**

The Who Held Your Position? webpage allows the user to input their current position (or any position, for that matter) and see who held that certain position across multiple fraternities. This will also display old position holders and keep record of them as well as current position holders.

**Who Held Your Position?**

Position Name:

Position Name: President  
Fraternity Name: Sigma Phi Epsilon  
Chapter: Oregon Alpha  
Member Name: Trevor Smith  
Date Elected: 2014-10-08

Position Name: President  
Fraternity Name: Lambda  
Chapter: AL  
Member Name: Tom Sanders  
Date Elected: 2014-12-11

**g) Schedule a Party (enterPartyInfo.php):**

**Enter Party Information**

Party Name:

Address:

Date:

Start Time:

Theme:

Host House:

Additional House:

This webpage provides a place for members to input upcoming parties and information about them. This info varies from the party name to the host house. After being entered here, the information is displayed in the confirmation page shown in part **h**.

**h) Party Confirmation (confirmPartyInput.php):**

This is the confirmation page to the Schedule a Party webpage specified in section **g**. This takes the information input by the user and formats it into a invitation style confirmation page.

**Confirmation**

Thank you for entering your party information. Have fun!

Party Name: New Years Eve  
Hosted by Lambda Chi Alpha and Sigma Phi Epsilon  
Address: 1015 NW Monroe Ave  
Date: 2014-12-31  
What time?: 7pm  
Theme: New Years

**i) Enter Personal Information (enterAttendInfo.php):**

The screenshot shows a web form titled "Enter Personal Information". It contains five input fields: "Student ID:", "Party Name:", "Party Date:" (with a date format hint "mm/dd/yyyy"), "Sober Brother:", and "Guest Name:". A "Submit" button is located at the bottom right of the form area. Below the form, there is a "Home Page" button.

The input box on this page asks the user for their personal information regarding their attendance to a certain party or event. The information will be sent to the confirmation page in part **j**.

**j) Attendance Confirmation (confirmAttendInfo.php):**

The confirmation page for the Enter Personal Information webpage shown in part **i**. takes the information submitted by the user and displays it on the screen in a very easy to follow description.

The screenshot shows a web page titled "Confirmation". It contains a message: "Thank you for submitting your attendance information! You are now scheduled to attend New Years Eve on 2014-12-31." Below this message, it displays the user's input: "Sober?: Yes" and "Guest: Christian Armatas". At the bottom, there is a "Home Page" button.

**k) Scheduled Parties and Member Attendance (printParties.php):**

The screenshot shows a web page titled "Scheduled Parties and Member Attendance". It features a form at the top with "Party Name:" (containing "New Years Eve") and "Party Date:" (containing "12/31/2014"), followed by an "Enter" button. Below the form, the page displays two sets of user information. The first set matches the information from part **j**: "Party Name: New Years Eve", "Party Date: 2014-12-31", "Member Name: Mihai Dan", "Sober?: Yes", and "Guest Name: Christian Armatas". The second set shows: "Party Name: New Years Eve", "Party Date: 2014-12-31", "Member Name: Jacob Brown", "Sober?: No", and "Guest Name: Kirsten Colaco". At the bottom, there is a "Home Page" button.

This webpage displays any events and members who attended each event based on the event (party) name and event (party) date. The names of members and guests will display as shown to the right.

#### 4. Implementation Details

Our application would be very difficult to create without a database management system like SQL to store our information. Creating several arrays to store and access the data from would be much more tedious than creating a database which can rely on simple php files and query statements to display information.

Some application requirements the DBMS makes possible includes the user information input functionality. The user clicks submit (assuming after personal info has been entered) which links an input page to a confirmation page. The confirmation page must be php to connect to a database because this is the file that can access and edit online databases using the query. For example, our confirmInput.php query looks like...

```
INSERT INTO final_membership(sID, mName, Age, yearInHouse, fName, chapter)  
VALUES ('$student_ID', '$member_name', '$age', '$year_in_house', '$frat_name',  
'$chapter').           // Stores sID, mName, Age, etc. into "final_membership"
```

printPositionInfo.php is one pages which displays information back to the user depending on if the input primary keys correspond to data. This is the query...

```
SELECT M.fName, M.chapter, M.mName, P.posName, P.dateElected, P.rank FROM  
final_position P, final_membership M WHERE P.sID = M.sID AND M.fName = '$fName'  
AND M.chapter = '$chapter'    // Selects info depending on user input
```

Although HTML is every simple webpage function (body, headers, text, etc.), HTML was only used in the index file and all of the input pages because they did not require access to a database. PHP was used as the primary file type for the print files and confirmation pages which either enter information into or retrieve information from a database. We used CSS to edit the format of tables and fieldsets.

#### 5. Evaluation

My partner and I checked every line, link, and input box of the physical website to make sure every page is intuitive and easy to follow. We ensured that every functional page performs correctly by checking the database after information was supposed to be entered. Also, we had a friend test every page of the website as a second opinion on how the site operates. The pages are formatted to appeal visually to the user as well as display the information in a simple and effective manner.

## **6. Future Work**

My partner and I had the idea of adding a philanthropy table to keep track of the major philanthropies a house/member would participate in or hosted. An additional table for treasurer would be valuable because it would allow one member for each house, the Treasurer, to input house expenses, grants, and damages as well as display a budget summary. The final idea we had to add onto the project in the future is to create a semi-randomized chore organizer which would assign each member in a particular fraternity and chapter a chore based off of their rank in the house (of the most recent position).

## **7. Lessons Learned**

A challenge we ran into during the design portion of this project was deciding how many associative tables were needed to make all the functions we desired. Also we had trouble deciding what the primary keys for each table would be. The largest problem during the implementation was the formatting of the images, tables, buttons (instead of direct web links) and formatting of “fieldsets.” Testing the system was pretty straight forward and we ran into few errors which were outside of our understanding.

If we were to complete this project again, from start to finish, we would spend more time on the design of each table. Better designed tables would have added more ease to some troubles we ran into when figuring out the query statements. Additionally, more time spent on learning how to format an html/php page could have made it look even more professional.

## Appendix A: Code

### confirmInput.php:

```
<html>
<html>
<body>

    <style type="text/css">
        body {
            background-color:#E0E0E0;
        }
        fieldset {
            width: 600px;
        }
        legend {
            font-size: 18px;
        }
        label.field {
            text-align: right;
            width: 150px;
            float: left;
            font-weight: bold;
        }
        input.text-300 {
            text-align: left;
            width: 300px;
            float: left;
        }
        fieldset p {
            clear: both;
            padding: 5px;
        }
    </style>

    <fieldset>
    <legend><h2>Confirmation</h2></legend>

<?php

    $student_ID = htmlspecialchars($_POST['ID']);
    $member_name = htmlspecialchars($_POST['memberName']);

## **Appendix B: Team Report**

Both my partner and I worked equally on this project. We primarily worked together on this using “paired programming” and the only time we worked separately, we each completed one file which were each a similar work load.

## **Appendix C: Test Subjects**

My partner and I tested this program throughout the entire development process to make sure every function worked properly once they were created. We inserted many test values into the database using our input functions and returned these values using our print functions.

A friend of ours named Logan Troyer tested out our website and all the functions to ensure everything was operating correctly. He entered his actual information into the database including fraternity name, chapter, position, and rank as well as scheduled a party and RSVP to the party.
